

Extracting Stock Data Using a Python Library

A company's stock share is a piece of the company more precisely:

A stock (also known as equity) is a security that represents the ownership of a fraction of a corporation. This entitles the owner of the stock to a proportion of the corporation's assets and profits equal to how much stock they own. Units of stock are called "shares." [1]

An investor can buy a stock and sell it later. If the stock price increases, the investor profits, If it decreases, the investor will incur a loss. Determining the stock price is complex; it depends on the number of outstanding shares, the size of the company's future profits, and much more. People trade stocks throughout the day the stock ticker is a report of the price of a certain stock, updated continuously throughout the trading session by the various stock market exchanges.

You are a data scientist working for a hedge fund; it's your job to determine any suspicious stock activity. In this lab you will extract stock data using a Python library. We will use the yfinance library, it allows us to extract data for stocks returning data in a pandas dataframe. You will use the lab to extract.

Table of Contents

- Using yfinance to Extract Stock Info
- Using yfinance to Extract Historical Share Price Data
- Using yfinance to Extract Historical Dividends Data
- Exercise

Estimated Time Needed: **30 min**

```
In [1]: !pip install yfinance==0.2.4
        #!pip install pandas==1.3.3

```

Using the yfinance Library to Extract Stock Data

Using the `Ticker` module we can create an object that will allow us to access functions to extract data. To do this we need to provide the ticker symbol for the stock, here the company is Apple and the ticker symbol is `AAPL`.

```

In [3]: apple = yf.Ticker("AAPL")

```

Now we can access functions and variables to extract the type of data we need. You can view them and what they represent here <https://aroussi.com/post/python-yahoo-finance>.

```

Stock Info

Using the attribute `info` we can extract information about the stock as a Python dictionary.

```

In [5]: import json
with open('apple.json') as json_file:
    apple_info = json.load(json_file)
    # Print the type of data variable

```

```
#print("Type:", type(apple_info))  
apple_info
```

```

```

We can get the `'country'` using the key `country`

```
In [6]: apple_info['country']
```

```
Out[6]: 'United States'
```

Extracting Share Price

A share is the single smallest part of a company's stock that you can buy, the prices of these shares fluctuate over time. Using the `history()` method we can get the share price of the stock over a certain period of time. Using the `period` parameter we can set how far back from the present to get data. The options for `period` are 1 day (1d), 5d, 1 month (1mo), 3mo, 6mo, 1 year (1y), 2y, 5y, 10y, ytd, and max.

```
In [7]: apple_share_price_data = apple.history(period="max")
```

The format that the data is returned in is a Pandas DataFrame. With the `Date` as the index the share `Open`, `High`, `Low`, `Close`, `Volume`, and `Stock Splits` are given for each day.

```
In [8]: apple_share_price_data.head()
```

```
Out[8]:
```

	Open	High	Low	Close	Volume	Dividends	Stock Splits
Date							
1980-12-12 00:00:00-05:00	0.099584	0.100017	0.099584	0.099584	469033600	0.0	0.0
1980-12-15 00:00:00-05:00	0.094821	0.094821	0.094388	0.094388	175884800	0.0	0.0
1980-12-16 00:00:00-05:00	0.087893	0.087893	0.087461	0.087461	105728000	0.0	0.0
1980-12-17 00:00:00-05:00	0.089625	0.090058	0.089625	0.089625	86441600	0.0	0.0
1980-12-18 00:00:00-05:00	0.092224	0.092657	0.092224	0.092224	73449600	0.0	0.0

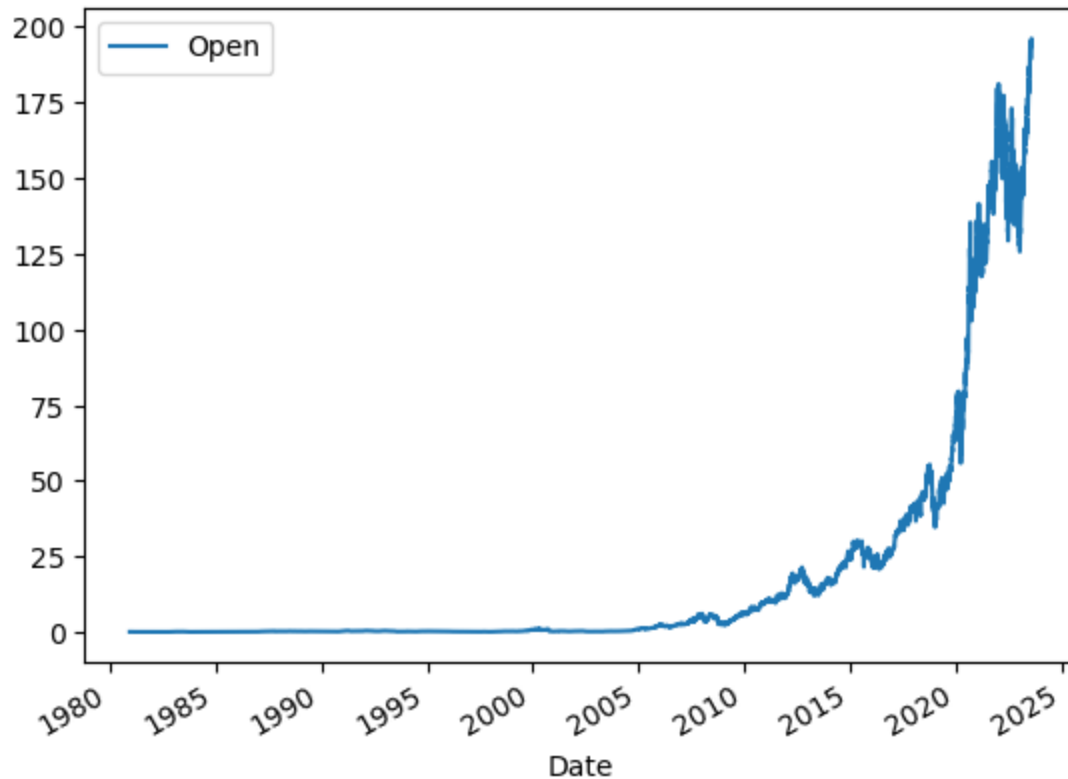

We can reset the index of the DataFrame with the `reset_index` function. We also set the `inplace` parameter to `True` so the change takes place to the DataFrame itself.

```
In [9]: apple_share_price_data.reset_index(inplace=True)
```

We can plot the `Open` price against the `Date` :

```
In [10]: apple_share_price_data.plot(x="Date", y="Open")
```

```
Out[10]: <AxesSubplot:xlabel='Date'>
```

Extracting Dividends

Dividends are the distribution of a company's profits to shareholders. In this case they are defined as an amount of money returned per share an investor owns. Using the variable `dividends` we can get a dataframe of the data. The period of the data is given by the period defined in the 'history' function.

```
In [11]: apple.dividends
```

```
Out[11]: Date
1987-05-11 00:00:00-04:00    0.000536
1987-08-10 00:00:00-04:00    0.000536
1987-11-17 00:00:00-05:00    0.000714
1988-02-12 00:00:00-05:00    0.000714
1988-05-16 00:00:00-04:00    0.000714
...
2022-05-06 00:00:00-04:00    0.230000
2022-08-05 00:00:00-04:00    0.230000
2022-11-04 00:00:00-04:00    0.230000
2023-02-10 00:00:00-05:00    0.230000
2023-05-12 00:00:00-04:00    0.240000
Name: Dividends, Length: 79, dtype: float64
```

We can plot the dividends overtime:

```
In [12]: apple.dividends.plot()
```

```
Out[12]: <AxesSubplot:xlabel='Date'>
```

Exercise

Now using the `Ticker` module create an object for AMD (Advanced Micro Devices) with the ticker symbol is `AMD` called; name the object `amd`.

```
